

Student Cardiac Screening Report

Your child, [REDACTED], attended a free preventative heart screening sponsored by SafeBeat. The purpose of the screening is to identify conditions that may lead to sudden cardiac arrest and death in children.

We conducted a brief physical exam - blood pressure, height and weight - and an ECG. Your child may have also received an echocardiogram. After considering all of the above, plus medical and family history that you provided, a cardiologist from our medical team recommends the following:

- No further action is required at this time. Please note that a child's heart can change as she/he develops, so you should continue to monitor your child's cardiac health.
- You should consult with a Pediatric Cardiologist to review the following:

chest pains during exercise (as noted on intake questionnaire) - requires echo prior to sports participation

- You should consult with your pediatrician about:

() hypertension () obesity () lipid screening () chest pain (non-cardiac)

() _____

This screening does not substitute for a regular, on-going relationship with your pediatrician, and no screening can identify 100% of the individuals at risk for a sudden cardiac event. We encourage your child to have annual physicals, be familiar with the warning signs and symptoms of sudden cardiac arrest, and discuss any concerns or changes with your Primary Care Provider.

If you have any questions, please feel free to contact us at info@safebeat.org.
